O. Legend

The Boxes at the start of each chapter should give a quick overview which classes had to be changed and which packages were affected by this.

Packages:

- ☐ api = no classes in this package were changed
- ☒ database = some parts of this package were changed
- ☐ modules = package contains parts which need to be translated in the future

Location of classes:

[A]	from package api	[M cityC]	modules.citygml.common
[Cmd]	cmd	[M cityE]	modules.citygml.exporter
[C]	config	[M cityI]	modules.citygml.importer
[D]	database	[M com]	modules.common
[E]	event	[M db]	modules.database
[G]	gui	[M kml]	modules.kml
[L]	log	[M pref]	modules.preferences
[P]	plugin	[oracle]	oracle.spatial.geometry
[U]	util		

Code:

- 59 changes start at line 59 in the corresponding class
- 115+ these lines could not be translated but were also not necessary in function
- rep this code-example is repeating itself in the same class
- rep+ this code-example is repeating itself in the same class and in other classes
- ```
//private Integer port = 1521; uncommented Oracle-specific code
 (already deleted from the classes)
private Integer port = 5432; PostGIS-specific code
```

# 1. Connection to the Database

| Packages:                                    | Classes:                                     |

Connection-handling hasn't changed much for the *PostgreSQL*-database only because the *Universal Connection Pool (UCP)* by Oracle is still used. The `PoolDataSource` of the *UCP* must pool a proper `DataSource` of *PostgreSQL* (`PGSimpleDataSource`). It was necessary to set the database-name separately. The method `conn.getSid()` fetches the right value of the according text-field but can't interpret it internally. Obviously that's because of the different definitions about the database itself between *Oracle* and *PostgreSQL*. To work within a network the server-name and the port-number have to be set as well. The URL which usually addresses the JDBC-Driver of a DBMS, could be left out. Connection-properties were uncommented as the `PGconnection` class of *PostgreSQL* only holds the same attributes than the Java `Connection` class. `CONNECTION_PROPERTY_USE_THREADLOCAL_BUFFER_CACHE` was not offered.

Unfortunately the use of Oracle's *UCP* is not conform to the OpenSource-effort behind the *PostGIS*-Version of the *3D-CityDB*. The Apache *Jakarta DBCP* was tested by the developers but found to work unacceptably worse than the *UCP*. The Connection Pools of Apache's *Tomcat 7* or *C3PO* should be an alternative. As seen by the number of orange packages in the overview-box, this means a lot of code-rework.

de.tub.citydb.config.project.database.**DBConnection**

```
59 //private Integer port = 1521;
```

```

 private Integer port = 5432;
de.tub.citydb.database.DatabaseConnectionPool

59 //private final String poolName = "oracle.pool";
 private final String poolName = "postgresql.pool";

109 // poolDataSource.setConnectionFactoryClassName(
 // "oracle.jdbc.pool.OracleDataSource");
 poolDataSource.setConnectionFactoryClassName(
 "org.postgresql.ds.PGSimpleDataSource");

110 poolDataSource.setDatabaseName(conn.getSid());

111 // poolDataSource.setURL("jdbc:oracle:thin:@/" + conn.getServer() + ":" +
 // conn.getPort() + "/" + conn.getSid());
 poolDataSource.setURL("jdbc:postgresql://" + conn.getServer() + ":" +
 conn.getPort() + "/" + conn.getSid());

or:
 poolDataSource.setServerName(conn.getServer());
 poolDataSource.setPortNumber(conn.getPort());

115+ // set connection properties

```

## 2. Calling the PL/pgSQL-functions

| Packages:                                | Classes:                          |

|                                          | [M cityE] DBWaterBody             |
|                                          | [U] DBUtil                        |

Most of the functionalities in the database-panel of the Importer/Exporter are calling stored procedures in the database. So the main changes in code were done in the PL/pgSQL-Scripts. Within Java only the names of the called functions were changed. The functions are bundled inside of a database-schema called "geodb\_pkg".

### 2a. index-functions, database-report, utility-functions inside of statements

The bigger the size of files to be imported the longer it to index the data after every inserted tuple. Therefore indexes are dropped and recreated after the Import. *Oracle* keeps Metadata of

a dropped index, *PostgreSQL* doesn't. An alternative way was programmed but it's not used now. The idea was to just set the index-status to invalid (`pg_index.indisvalid`) that it stays inactive during the import and then REINDEX it afterwards. Performance was only tested with small datasets. If the switch-case is used in the future, classes `IndexOperation` and `Importer` need to be changed. Corresponding PL/pgSQL-Scripts have to be added as well, indeed. They are already written but are not a part of the recent release.

de.tub.citydb.modules.database.gui.operations.**IndexOperation**  
 de.tub.citydb.modules.citygml.importer.controller.**Importer**

```

Drop-Case
301 if (!parts[4].equals("DROPPED")) {
rep+ Switch-Case
 if (!parts[4].equals("INVALID")) {

```

für alle de.tub.citydb.modules.citygml.exporter.database.content.**DB\***

```

//geodb_util.transform_or_null(...)
geodb_pkg.util_transform_or_null(...)

```

de.tub.citydb.util.database.**DBUtil**

```

73 // private static OracleCallableStatement callableStmt;
 private static CallableStatement callableStmt;

91 // rs = stmt.executeQuery("select * from table(geodb_util.db_metadata)");
 rs = stmt.executeQuery("select * from geodb_pkg.util_db_metadata() as t");

199 // callableStmt = (OracleCallableStatement)conn.prepareCall("{? = call
rep // geodb_stat.table_contents}");
 callableStmt = (CallableStatement)conn.prepareCall("{? = call
 geodb_pkg.stat_table_contents()}");

200 // callableStmt.registerOutParameter(1, OracleTypes.ARRAY, "STRARRAY");
rep callableStmt.registerOutParameter(1, Types.ARRAY);

203 // ARRAY result = callableStmt.getARRAY(1);
rep Array result = callableStmt.getArray(1);

~400 // String call = type == DBIndexType.SPATIAL ?
rep // "{? = call geodb_idx.drop_spatial_indexes}" :
 // "{? = call geodb_idx.drop_normal_indexes}";
Drop Case:
String call = type == DBIndexType.SPATIAL ?
 "{? = call geodb_pkg.idx_drop_spatial_indexes}" :
 "{? = call geodb_pkg.idx_drop_normal_indexes}";
or Switch-Case:
String call = type == DBIndexType.SPATIAL ?
 "{? = call geodb_pkg.idx_switch_off_spatial_indexes}" :
 "{? = call geodb_pkg.idx_switch_off_normal_indexes}";
// callableStmt = (OracleCallableStatement)conn.prepareCall(call);
callableStmt = (CallableStatement)conn.prepareCall(call);

~590 // callableStmt = (OracleCallableStatement)conn.prepareCall("{? = call

```

```
// geodb_util.error_msg(?)}");
callableStmt = (CallableStatement)conn.prepareCall("{? = call
geodb_pkg.util_error_msg(?)}");
```

## 2b. Calculation of the BoundingBox

For the calculation of the BoundingBox workspace-variables were uncommented. The query strings had to call equivalent *PostGIS*-Functions (e.g. `sdo_aggr_mbr --> ST_Extent`, `geodb_util.to2d --> ST_Force_2d`). As rectangle geometries can't be shorten in number of points like in *Oracle* (LLB, URT), 5 Points were needed for the coordinate-transformation. The query did not work with a `PreparedStatement`. Thus a statement-object was executed directly.

de.tub.citydb.util.database.**DBUtil**

```
237 // public static BoundingBox calcBoundingBox(Workspace workspace,
// FeatureClassMode featureClass) throws SQLException {
public static BoundingBox calcBoundingBox(FeatureClassMode featureClass)
 throws SQLException {

249 // String query = "select sdo_aggr_mbr(geodb_util.to_2d(
// ENVELOPE, (select srid from database_srs))
// from CITYOBJECT where ENVELOPE is not NULL";
String query = "select ST_Extent(ST_Force_2d(envelope))::geometry
 from cityobject where envelope is not null";

314 // double[] points = jGeom.getOrdinatesArray();
// if (dim == 2) {
// xmin = points[0];
// ymin = points[1];
// xmax = points[2];
// ymax = points[3];
// } else if (dim == 3) {
// xmin = points[0];
// ymin = points[1];
// xmax = points[3];
// ymax = points[4];
// }
xmin = (geom.getPoint(0).x);
ymin = (geom.getPoint(0).y);
xmax = (geom.getPoint(2).x);
ymax = (geom.getPoint(2).y);

625 // psQuery = conn.prepareStatement("select SDO_CS.TRANSFORM(
// MDSYS.SDO_GEOMETRY(2003, " + sourceSrid + ", NULL,
// MDSYS.SDO_ELEM_INFO_ARRAY(1, 1003, 1), " +
// "MDSYS.SDO_ORDINATE_ARRAY(?,?,?,?)), " + targetSrid + ")from dual");
// psQuery.setDouble(1, bbox.getLowerLeftCorner().getX());
// psQuery.setDouble(2, bbox.getLowerLeftCorner().getY());
// psQuery.setDouble(3, bbox.getUpperRightCorner().getX());
// psQuery.setDouble(4, bbox.getUpperRightCorner().getY());
conn = dbConnectionPool.getConnection();
query = conn.createStatement();
rs = query.executeQuery("select ST_TRANSFORM(ST_GeomFromText('POLYGON((" +
```

```

bbox.getLowerLeftCorner().getX() + " " +
bbox.getLowerLeftCorner().getY() + "," +

### 3a. The database-SRS

Until now *PostGIS* doesn't offer 3D-spatial-reference-systems by default. INSERT-examples for *PostGIS* can be found at [spatialreference.org](http://spatialreference.org). Unfortunately 2D and 3D geographic reference systems are equally typed as `GEOGCS`. The function `is3D` wouldn't detect 3D-SRIDs though. A trick might be to change the INSERT-statement by [spatialreference.org](http://spatialreference.org) from `GEOGCS` to `GEOGCS3D`. Then `is3D()` would work as the type is listed in the `DatabaseSrsType` class. It's not sure how 3D-SRIDs will be handled in future *PostGIS*-releases. *Oracle Spatial* has got some strict rules how to work with them. This includes certain checks on the data, which are not needed for the *PostGIS*-Version at the moment. It can be noticed that the `spatial_ref_sys` table in *PostGIS* contains less columns than *Oracle's* `SDO_COORD_REF_SYS`-table. Most of the information is stored in the text-column `srttext`. It can be extracted with String-functions but it's an kind of ugly way.

de.tub.citydb.api.database.**DatabaseSrsType**

```
4 PROJECTED("PROJCS", "Projected"),
 GEOGRAPHIC2D("GEOGCS", "Geographic2D"),
 GEOCENTRIC("GEOCCS", "Geocentric"),
 VERTICAL("VERT_CS", "Vertical"),
 ENGINEERING("LOCAL_CS", "Engineering"),
 COMPOUND("COMPD_CS", "Compound"),
 GEOCENTRIC("n/a", "Geogentric"),
 GEOGRAPHIC3D("GEOGCS3D", "Geographic3D"),
 UNKNOWN("", "n/a");
```

## de.tub.citydb.api.config.**DatabaseSrs**

```
107 // public boolean is3D() {
 // return type == DatabaseSrsType.COMPOUND || type ==
 // DatabaseSrsType.GEOGRAPHIC3D;
 // }
```

## de.tub.citydb.gui.factory.**SrsComboBoxFactory**

```
188 // if (showOnlySameDimension && refSys.is3D() != dbRefSys.is3D())
 // continue;
```

## de.tub.citydb.modules.citygml.exporter.controller.**Exporter**

```
231+ // if (internalConfig.isTransformCoordinates()) {
```

## de.tub.citydb.util.database.**DBUtil**

```
141 // psQuery = conn.prepareStatement("select coord_ref_sys_name,
 // coord_ref_sys_kind from sdo_coord_ref_sys where srid = ?");
psQuery = conn.prepareStatement("select split_part(srtext, '\",', 2) as
 coord_ref_sys_name, split_part(srtext, '[', 1) as coord_ref_sys_kind
 FROM spatial_ref_sys WHERE SRID = ? ");

706 // if (!srs.is3D())

709+ // psQuery = conn.prepareStatement(srs.getType() ==
 // DatabaseSrsType.GEOGRAPHIC3D ?
 // "select min(crs2d.srid) from sdo_coord_ref_sys crs3d,
 // sdo_coord_ref_sys crs2d where crs3d.srid = " + srs.getSrid() +
 // " and crs2d.coord_ref_sys_kind = 'GEOGRAPHIC2D'
 // and crs3d.datum_id = crs2d.datum_id" :
 // "select cmpd_horiz_srid from sdo_coord_ref_sys
 // where srid = " + srs.getSrid());
psQuery = conn.prepareStatement(srs.getType() == DatabaseSrsType.COMPOUND ?
 "select split_part((split_part(srtext, 'AUTHORITY[\"EPG\", \"\", 5)), '\",', 1)
 from spatial_ref_sys where auth_srid = " + srs.getSrid() :
 // searching 2D equivalent for 3D SRID
 "select min(crs2d.auth_srid) from spatial_ref_sys crs3d, spatial_ref_sys
 crs2d where (crs3d.auth_srid = " + srs.getSrid() + " and split_part

 (split_part(crs2d.srtext, 'AUTHORITY[\"EPG\", \"\", 3)), '\",', 1))
 OR " +
 // if srtext has been changed for Geographic3D
 "(crs3d.auth_srid = " + srs.getSrid() + " and
 split_part(crs3d.srtext, '[', 1) LIKE 'GEOGCS3D' AND
 split_part(crs2d.srtext, '[', 1) LIKE 'GEOGCS' " +
 //do they have the same Datum_ID?
 "and split_part(
 (split_part(crs3d.srtext, 'AUTHORITY[\"EPG\", \"\", 3)), '\",', 1)
 = split_part(
 (split_part(crs2d.srtext, 'AUTHORITY[\"EPG\", \"\", 3)), '\",', 1))");
```

### 3b. BoundingBox-filter and OptimizerHints in DBSplitter.java

`DBSplitter.java` manages the filtering of data by a given bounding box. In *Oracle Spatial* the spatial operation `SDO_RELATE` is used for that. `SDO_RELATE` checks topological relations between geometries according to the 9-intersection Matrix (DE-9IM). It's possible to combine the mask-attributes with a logical OR (+). This is not adoptable for *PostGIS*, as the equivalent `ST_Relate`-operation can only use one mask. Thus the query-string is built by iterations through a list with the mask-attributes (`maskTypes`). The `StringBuilder` is used for building the query-string.

Another feature of *Oracle* which is used in the `DBSplitter` class is the "Optimizer Hint". It is used to tell the internal query-optimizer which query-plan to prefer. As there are no such Optimizer Hints in *PostgreSQL* they were uncommented.

`de.tub.citydb.modules.citygml.exporter.database.content.DBSplitter`

```
163 // String mask = ((tiledBBox.getTiling().getMode() != TilingMode.NO_TILING
// || tiledBBox.isSetOverlapMode())) ?
// "INSIDE+CONTAINS+EQUAL+COVERS+COVEREDBY+OVERLAPBDYINTERSECT" :
// "INSIDE+COVEREDBY+EQUAL";

// bboxFilter = "SDO_RELATE(co.ENVELOPE, MDSYS.SDO_GEOMETRY(2003, " +
// bboxSrid + ", NULL, " +
// "MDSYS.SDO_ELEM_INFO_ARRAY(1, 1003, 3), " +
// "MDSYS.SDO_ORDINATE_ARRAY(" + minX + ", " + minY + ", "
// + maxX + ", " + maxY + ")), " +
// "'querytype=WINDOW mask=" + mask + "') = 'TRUE'";
List<String> maskType = new ArrayList<String>();
StringBuilder tmp = new StringBuilder();

if ((tiledBBox.getTiling().getMode() != TilingMode.NO_TILING ||
 tiledBBox.isSetOverlapMode())) {

 maskType.add("T*F**F***"); //1 - INSIDE
 maskType.add("T*****FF*"); //2 - CONTAINS
 maskType.add("T*F***FFF*"); //3 - EQUAL
 maskType.add("T*****FF*"); //4 - COVERS
 maskType.add("T*****FF*"); //5 - COVERS
 maskType.add("***T**FF*"); //6 - COVERS
 maskType.add("*****T*FF*"); //7 - COVERS
 maskType.add("**TF**F***"); //8 - COVEREDBY
 maskType.add("***FT*F***"); //9 - COVEREDBY
 maskType.add("***F*TF***"); //10 - COVEREDBY
 maskType.add("T*T***T**"); //11 - OVERLAP
}
else
{
 maskType.add("T*F**F***"); //1 - INSIDE
 maskType.add("**TF**F***"); //2 - COVEREDBY
 maskType.add("***FT*F***"); //3 - COVEREDBY
 maskType.add("***F*TF***"); //4 - COVEREDBY
 maskType.add("T*F***FFF*"); //5 - EQUAL
}

int dbSrid = dbConnectionPool.getActiveConnectionMetaData().
 getReferenceSystem().getSrid();
```

```

String geom = "st_geomFromText('POLYGON((" +
 minX + " " + minY + "," +
 maxX + " " + minY + "," +
 maxX + " " + maxY + "," +
 minX + " " + maxY + "," +
 minX + " " + minY + "))'," + bboxSrid + ")";

// srid of query window cannot be different from database srid
if (bboxSrid != dbSrid)
geom = "geodb_pkg.util_transform_or_null(" + geom + ", " + dbSrid + ")";

tmp.append("(");

for (int i=0; i < maskType.size(); i++){
 tmp.append("st_relate(co.ENVELOPE, " + geom + ", '"
 + maskType.get(i) + "') = 'TRUE'");

 if (i < maskType.size() - 1)
 tmp.append(" or ");
}
tmp.append(")");
bboxFilter = tmp.toString();

```

### 3c. Query-statements for Import

Some queries of the Importer-classes use *Oracle*-specific functions.

de.tub.citydb.modules.citygml.exporter.database.content.**DBAppearance**

```

138 // nvl(sd.TEX_IMAGE.getContentLength(), 0) as DB_TEX_IMAGE_SIZE,
rep // sd.TEX_IMAGE.getMimeType() as DB_TEX_IMAGE_MIME_TYPE, sd.TEX_MIME_TYPE,
 COALESCE(length(sd.TEX_IMAGE), 0) as DB_TEX_IMAGE_SIZE, sd.TEX_MIME_TYPE,

```

de.tub.citydb.modules.citygml.importer.database.content.**DBCityObject**

```

134 // SYSDATE
 now()

```

de.tub.citydb.modules.citygml.importer.database.content.**DBCityObjectGenericAttrib**

```

63 // CITYOBJECT_GENERICATT_SEQ.nextval
 nextval('CITYOBJECT_GENERICATTRIB_ID_SEQ')

```

de.tub.citydb.modules.citygml.importer.database.content.**DBExternalReference**

```

58 // EXTERNAL_REF_SEQ.nextval
 nextval('EXTERNAL_REFERENCE_ID_SEQ')

```

de.tub.citydb.modules.citygml.importer.database.content.**DBSequencer**

```

53 // pstmt = conn.prepareStatement("select " + sequence.toString() +

```

```

 ".nextval from dual");
 pstmt = conn.prepareStatement("select nextval('" + sequence.toString() +
 "')");

```

de.tub.citydb.modules.citygml.importer.database.content.**DBSurfaceGeometry**  
 de.tub.citydb.modules.citygml.importer.database.xlink.resolver.**XlinkSurfaceGeometry**

```

126 // SURFACE_GEOMETRY_SEQ.nextval
/98 nextval('SURFACE_GEOMETRY_ID_SEQ')

```

### 3d. Create Table without "nologging"

There is no nologging-Option for CREATE-statements in *PostgreSQL*.

de.tub.citydb.modules.citygml.common.database.cache.model.**CacheTableModel**

```

95 // " nologging" +

```

de.tub.citydb.modules.citygml.common.database.cache.**HeapCacheTable**

```

158 model.createIndexes(conn, tableName/*, "nologging"*/);

```

### 3e. Data types in cached tables

In the folder common.database.cache.model several classes had to be changed due to different data types of the DMBS. NUMBER to NUMERIC (ID-columns = integer), VARCHAR2 to VARCHAR.

## 4. Implicit sequences

| Packages:                         | Classes:                          |

|                                   | [M cityI] DBThematicSurface       |
|                                   | [M cityI] DBTrafficArea           |
|                                   | [M cityI] DBTransportationComplex |
|                                   | [M cityI] DBWaterBody             |
|                                   | [M cityI] DBWaterBoundarySurface  |
|                                   | [M cityI] XlinkDeprecatedMaterial |
|                                   | [M cityI] XlinkSurfaceGeometry    |

In *PostgreSQL* it's quite common to assign the data type `SERIAL` to ID-columns which are used as primary keys. `SERIAL` implicitly creates a sequence with the names of the table, the column and the ending `"_SEQ"`. The declaration `"CREATE SEQUENCE"` must not be written manually like in *Oracle*. But this holds a trap. As names are created automatically with `SERIAL` they differ from the customized names in *Oracle*. See also **3c** for examples.

de.tub.citydb.modules.citygml.importer.database.content.**DBSequencerEnum**

```
32 //public enum DBSequencerEnum {
 // ADDRESS_SEQ,
 // APPEARANCE_SEQ,
 // CITYOBJECT_SEQ,
 // SURFACE_GEOMETRY_SEQ,
 // IMPLICIT_GEOMETRY_SEQ,
 // SURFACE_DATA_SEQ,
 public enum DBSequencerEnum {
 ADDRESS_ID_SEQ,
 APPEARANCE_ID_SEQ,
 CITYOBJECT_ID_SEQ,
 SURFACE_GEOMETRY_ID_SEQ,
 IMPLICIT_GEOMETRY_ID_SEQ,
 SURFACE_DATA_ID_SEQ,
```

## 5. How to work with database geometries in Java

| Packages:                                           | Classes:                          |

|                                                     | [oracle] SyncJGeometry            |

Translating the processing of geometries to the *PostGIS*-JDBC was with no doubt the toughest job to do. This chapter shortly explains how geometries were parsed from a CityGML-document and inserted into the database and all the way back.

### 5a. From CityGML to 3D-CityDB

The *Oracle*-JDBC handles geometries with one central class called `JGeometry`. One instance of `JGeometry` represents `SDO_GEOMETRY` in the Java-world. All methods of different geometric types return `JGeometry`. They need an array of coordinates, the number of dimensions and a known SRID for doing so. The geometries of CityGML are described by geometric primitives from the `citygml4j.lib`. Their values are first transferred to list-elements and then iterated into arrays to be used by the described `JGeometry`-methods. `JGeometry` can't be set as an object for the database-statements. It needs to be "stored" into a `STRUCT`-object, which is a wrapper-class for `JGeometry`. This wrapper makes the object more generic to be used by the `PreparedStatement`-method `setObject`.

For the *PostGIS*-JDBC the combination of geometry-class and wrapper-class is represented by `Geometry` and `PGGeometry`. `Geometry` offers some geometric operations, but to create an instance of `Geometry` the `PGGeometry`-method `geomFromString(String)` has to be used. So the values of list-elements have to iteratively build up a string and not fill an array. The

String represents the geometries in Well Known Text (WKT), which means blank spaces between coordinates (x y z) instead of commas. To be interpreted by the database the geometries have to be wrapped as a `PGgeometry`-object and then set for the `PreparedStatement`.

#### de.tub.citydb.modules.citygml.importer.database.content.**DBAddress**

```
91 // private DBSdoGeometry sdoGeometry;
rep+ private DBStGeometry stGeometry;

106 // sdoGeometry = (DBSdoGeometry)dbImporterManager.getDBImporter(
rep+ DBImporterEnum.SDO_GEOMETRY);
 stGeometry = (DBStGeometry)dbImporterManager.getDBImporter(
 DBImporterEnum.ST_GEOMETRY);

133 // JGeometry multiPoint = null;
rep+ PGgeometry multiPoint = null;

224 // multiPoint = sdoGeometry.getMultiPoint(address.getMultiPoint());
rep+ multiPoint = stGeometry.getMultiPoint(address.getMultiPoint());

 // if (multiPoint != null) {
 // Struct multiPointObj= SyncJGeometry.syncStore(multiPoint,batchConn);
 // psAddress.setObject(8, multiPointObj);
 // } else
 // psAddress.setNull(8, Types.STRUCT, "MDSYS.SDO_GEOMETRY");
 if (multiPoint != null) {
 psAddress.setObject(8, multiPoint);
 } else
 psAddress.setNull(8, Types.OTHER, "ST_GEOMETRY");
```

#### de.tub.citydb.modules.citygml.importer.database.content.**DBCityObject**

```
211 // double[] ordinates = new double[points.size()];
rep+ // int i = 0;
 // for (Double point : points)
 // ordinates[i++] = point.doubleValue();
 // JGeometry boundedBy =
 // JGeometry.createLinearPolygon(ordinates, 3, dbSrid);
 // STRUCT obj = SyncJGeometry.syncStore(boundedBy, batchConn);
 //
 // psCityObject.setObject(4, obj);
 String geomEWKT = "SRID=" + dbSrid + ";POLYGON(";
 for (int i=0; i<points.size(); i+=3){
 geomEWKT += points.get(i) + " " + points.get(i+1) + " " +
 points.get(i+2) + ",";
 }
 geomEWKT = geomEWKT.substring(0, geomEWKT.length() - 1);
 geomEWKT += "));";

 Geometry boundedBy = PGgeometry.geomFromString(geomEWKT);
 PGgeometry pgBoundedBy = new PGgeometry(boundedBy);

 psCityObject.setObject(4, pgBoundedBy);
```

```

68 // SDO_GEOMETRY();
 ST_GEOMETRY();

```

```

88 // public JGeometry getPoint(PointProperty pointProperty) {
rep // JGeometry pointGeom = null;
 public PGGeometry getPoint(PointProperty pointProperty) throws
 SQLException {
 Geometry pointGeom = null;

99 // double[] coords = new double[values.size()];
 // int i = 0;
 // for (Double value : values)
 // coords[i++] = value.doubleValue();
 // pointGeom = JGeometry.createPoint(coords, 3, dbSrid);
 pointGeom = PGGeometry.geomFromString("SRID=" + dbSrid + ";POINT(" +
 values.get(0) + " " + values.get(1) + " " + values.get(2) + ")");

171 // if (!pointList.isEmpty()) {
rep // Object[] pointArray = new Object[pointList.size()];
 // int i = 0;
 // for (List<Double> coordsList : pointList) {
 // if (affineTransformation)
 // dbImporterManager.getAffineTransformer().
 // transformCoordinates(coordsList);
 //

## 5b. From 3D-CityDB back to CityGML

Simply said, the export works the other way around. In *Oracle* the `ResultSet` is casted into the `STRUCT` data type and then “loaded” into a `JGeometry`-Object. The *PostGIS* way with `PGgeometry.getGeometry` works in a similar manner. In *Oracle* `JGeometry` can easily transferred into arrays and processed back again into list-elements for the CityGML-primitives. The `ELEM_INFO_ARRAY` helps a lot to distinguish between geometric types. The *PostGIS*-JDBC offers different sub-classes from `Geometry.java`. `ComposedGeom` and `MultiLineString` were used for addressing subgeometries. Fortunately this didn’t lead to conflicts against the names of the `citygml4j.lib`.

de.tub.citydb.modules.citygml.exporter.database.content.**DBAppearance**

```

822 // STRUCT struct = (STRUCT)rs.getObject("GT_REFERENCE_POINT");
rep+ // if (!rs.isNull() && struct != null) {
 // JGeometry jGeom = JGeometry.load(struct);
 // double[] point = jGeom.getPoint();
 //
 // if (point != null && point.length >= 2) {
 // Point referencePoint = new PointImpl();
 // List<Double> value = new ArrayList<Double>();
 // value.add(point[0]);
 // value.add(point[1]);
 PGgeometry pgGeom = (PGgeometry)rs.getObject("GT_REFERENCE_POINT");
 if (!rs.isNull() && pgGeom != null) {
 Geometry geom = pgGeom.getGeometry();
 Point referencePoint = new PointImpl();
 List<Double> value = new ArrayList<Double>();
 value.add(geom.getPoint(0).getX());
 value.add(geom.getPoint(0).getY());

```

```

## 5c. Synchronization of geometric functions

It's proven that JGeometry's method `store(JGeometry)` is not threadsafe and deadlocks can occur. This problem is avoided by synchronizing the storing of JGeometries into STRUCT-objects with a Java-Reentrant-Lock (inside `SyncJGeometry.java`). Until now no such problem occurred during *PostGIS* processes.

## 6. How to deal with textures

| Packages:                                   | Classes:                              |

| <input type="checkbox"/> plugin             |                                       |
| <input type="checkbox"/> util               |                                       |

As the data type `ORDImage` differs a lot from the `BYTEA` in *PostgreSQL* it's not surprising that the im- and export of textures had to be changed in many aspects. The advantage of `ORDImage` over common BLOBs is the possibility to query metadata from the images and also use functions similar to a graphic-processing-software. Some of these features are called in the `DBAppearance` class (see also chapter 3d). But all in all the *3D-CityDB* hardly uses the abilities of `ORDImage`. Even Oracle itself recommended the use of BLOBs for the *3D-CityDB* to the developers.

### 6a. Import of textures

As seen on the following examples the code for importing textures could be reduced to a few lines. Inserting `ORDImages` works as follows:

1. initialization in the database with `ordimage.init()`
2. a select for update locks the `ResultSet`-cursor for the row to be updated
3. the database-`ORDImage` is transferred to a java-`ORDImage` but still empty
4. `loadDataFromInputStream` fills the empty `ORDImage.java`
5. `setORADATA` sets the `ORDImage.java` in the `PreparedStatement` which inserts the data by updating the table `Surface_Data`

With BLOBs the output of the `InputStream` can directly be set in the `PreparedStatement` with `setBinaryStream`. Peace of cake.

de.tub.citydb.modules.citygml.importer.database.xlink.resolver.**XlinkTextureImage**

```
74 // psPrepare = externalFileConn.prepareStatement(
 "update SURFACE_DATA set TEX_IMAGE=ordimage.init() where ID=?");
// psSelect = externalFileConn.prepareStatement(
 "select TEX_IMAGE from SURFACE_DATA where ID=? for update");
// psInsert = (OraclePreparedStatement)externalFileConn.prepareStatement(
 "update SURFACE_DATA set TEX_IMAGE=? where ID=?");
psInsert = externalFileConn.prepareStatement(
 "update SURFACE_DATA set TEX_IMAGE=? where ID=?");
```

```

113+ // // second step: prepare ORDIMAGE
// psPrepare.setLong(1, xlink.getId());
// psPrepare.executeUpdate();
//
// // third step: get prepared ORDIMAGE to fill it with contents
// psSelect.setLong(1, xlink.getId());
// OracleResultSet rs = (OracleResultSet)psSelect.executeQuery();
// if (!rs.next()) {
// LOG.error("Database error while importing texture file '" +
// imageFileName + "'.");
//
// rs.close();
//
// externalFileConn.rollback();
// return false;
// }

114 // OrdImage imgProxy = (OrdImage)rs.getORADData(
// 1,OrdImage.getORADDataFactory());
// rs.close();
FileInputStream fis = new FileInputStream(imageFile);

120 // boolean letDBdetermineProperties = true;
// if (isRemote) {
// InputStream stream = imageURL.openStream();
// imgProxy.loadDataFromInputStream(stream);
// } else {
// imgProxy.loadDataFromFile(imageFileName);
//
// // determing image formats by file extension
// int index = imageFileName.lastIndexOf('.');
// if (index != -1) {
// String extension = imageFileName.substring(
// index + 1, imageFileName.length());
//
// if (extension.toUpperCase().equals("RGB")) {
// imgProxy.setMimeType("image/rgb");
// imgProxy.setFormat("RGB");
// imgProxy.setContentLength(1);
//
// letDBdetermineProperties = false;
// }
// }
// }
// if (letDBdetermineProperties)
// imgProxy.setProperties();
//
// psInsert.setORADData(1, imgProxy);
// psInsert.setLong(2, xlink.getId());
// psInsert.execute();
// imgProxy.close();
if (isRemote) {
 InputStream stream = imageURL.openStream();
 psInsert.setBinaryStream(1, stream);
} else {
 psInsert.setBinaryStream(1, fis, (int)imageFile.length());
}
psInsert.setLong(2, xlink.getId());
psInsert.execute();
externalFileConn.commit();
return true;

```

## 6b. Export of textures

The export of textures in the *Oracle*-Version only needs a few lines but is also very *ORDImage*-specific. Two ways exist for the *PostgreSQL*-BYTEAs. No performance-differences could be noticed until now. The first way was preferred as no array with a fixed size had to be declared. This seemed to be more flexible than the second way.

de.tub.citydb.modules.citygml.exporter.database.xlink.**DBXlinkExporterTextureImage**

```
126 // OracleResultSet rs = (OracleResultSet)psTextureImage.executeQuery();
 ResultSet rs = (ResultSet)psTextureImage.executeQuery();

141 // // read oracle image data type
 // OrdImage imgProxy = (OrdImage)rs.getORADData(
 // 1, OrdImage.getORADDataFactory());
 // rs.close();
 //
 // if (imgProxy == null) {
 // LOG.error("Database error while reading texture file: " + fileName);
 // return false;
 // }
 //
 // try {
 // imgProxy.getDataInFile(fileURI);
 // } catch (IOException ioEx) {
 // LOG.error("Failed to write texture file " + fileName + ": " +
 // ioEx.getMessage());
 // return false;
 // } finally {
 // imgProxy.close();
 // }
```

1st way:

```
byte[] imgBytes = rs.getBytes(1);
try {
 FileOutputStream fos = new FileOutputStream(fileURI);
 fos.write(imgBytes);
 fos.close();
} catch (FileNotFoundException fnfEx) {
 LOG.error("File not found " + fileName + ": " + fnfEx.getMessage());
} catch (IOException ioEx) {
 LOG.error("Failed to write texture file " + fileName + ": " +
 ioEx.getMessage());
 return false;
}
```

2nd way:

```
InputStream imageStream = rs.getBinaryStream(1);
if (imageStream == null) {
 LOG.error("Database error while reading texture file: " + fileName);
 return false;
}
try {
 byte[] imgBuffer = new byte[1024];
 FileOutputStream fos = new FileOutputStream(fileURI);
 int l;
 while ((l = imageStream.read(imgBuffer)) > 0) {
 fos.write(imgBuffer, 0, l);
 }
}
```

```
 }
 fos.close();
} catch (FileNotFoundException fnfEx) {
 LOG.error("File not found " + fileName + ": " + fnfEx.getMessage());
} catch (IOException ioEx) {
 LOG.error("Failed to write texture file " + fileName + ": " +
 ioEx.getMessage());
 return false; }
}
```

## 7. The batchsize of PostgreSQL

| Packages:                                   | Classes:                                    |

The maximum batchsize of *PostgreSQL* was set to 10000. More might be possible, but was not tested. This change in the `Internal` class caused several classes to be changed for compiling. They are all listed in the overview-box.

de.tub.citydb.config.internal.**Internal**

```
40 // public static final int ORACLE_MAX_BATCH_SIZE = 65535;
 public static final int POSTGRESQL_MAX_BATCH_SIZE = 10000;
```

In the following classes no equivalent methods could be found for the Java PreparedStatement. The psDrain-batch is now executed and not sent.

de.tub.citydb.modules.citygml.exporter.database.gmlid.**DBExportCache**

de.tub.citydb.modules.citygml.importer.database.gmlid.**DBImportCache**

```
84 // ((OraclePreparedStatement)psDrains[i]).setExecuteBatch(batchSize);
```

```
145 // ((OraclePreparedStatement)psDrain).sendBatch();
 psDrain.executeBatch();
```

## 8. Workspace Management

| Packages:                                    | Classes:                              |
|----------------------------------------------|---------------------------------------|

|                                              | [M DB] BoundingBoxOperation           |
|                                              | [M DB] DatabaseOperationsPanel        |
|                                              | [M DB] ReportOperation                |
|                                              | [U] DBUtil                            |
|                                              | [U] Util                              |

*PostgreSQL* does not offer a workspace or history management like *Oracle* does. Every part in the Java-code concerning these workspace-features was uncommented but not deleted as there might be a solution for this in the future. A versioning-approach for *PostGIS* already exists with *pgvs*. It will be considered for implementation within the next months. The affected packages are colored orange.

## 9. KML-Exporter

Due to the modular architecture of the *Importer/Exporter* no overview-box is needed here as the port of the *KML-Exporter* only affected classes of its module. The code-design differs from the CityGML-module. Database-queries are collected in one central class and were used as string-constants in other classes. Database-geometries were parsed in to array to create the KML-primitives. Until now it's only possible to export buildings. In the future a generic class will be used as a parent for sub-classes for other thematic modules of the *3D-CityDB*.

### 9a. Queries

de.tub.citydb.modules.kml.database.**Queries**

```
409 // public static final String INSERT_GE_ZOFFSET =
// "INSERT INTO CITYOBJECT_GENERICATTRIB (ID, ATTRNAME, DATATYPE,
// STRVAL, CITYOBJECT_ID) " +
// "VALUES (CITYOBJECT_GENERICATT_SEQ.NEXTVAL, ?, 1, ?,
// (SELECT ID FROM CITYOBJECT WHERE gmlid = ?))";
//
// public static final String TRANSFORM_GEOMETRY_TO_WGS84 =
// "SELECT SDO_CS.TRANSFORM(?, 4326) FROM DUAL";
//
// public static final String TRANSFORM_GEOMETRY_TO_WGS84_3D =
// "SELECT SDO_CS.TRANSFORM(?, 4329) FROM DUAL";
//
// public static final String GET_ENVELOPE_IN_WGS84_FROM_GML_ID =
// "SELECT SDO_CS.TRANSFORM(co.envelope, 4326) " +
// "FROM CITYOBJECT co " +
// "WHERE co.gmlid = ?";
//
// public static final String GET_ENVELOPE_IN_WGS84_3D_FROM_GML_ID =
// "SELECT SDO_CS.TRANSFORM(co.envelope, 4329) " +
// "FROM CITYOBJECT co " +
// "WHERE co.gmlid = ?";
public static final String INSERT_GE_ZOFFSET =
 "INSERT INTO CITYOBJECT_GENERICATTRIB (ID, ATTRNAME, DATATYPE, " +
 "STRVAL, CITYOBJECT_ID) " +
 "VALUES (nextval('CITYOBJECT_GENERICATTRIB_ID_SEQ'), ?, 1, ?, " +
 "(SELECT ID FROM CITYOBJECT WHERE gmlid = ?))";

public static final String TRANSFORM_GEOMETRY_TO_WGS84 =
 "SELECT ST_Transform(?, 4326)";

public static final String TRANSFORM_GEOMETRY_TO_WGS84_3D =
 "SELECT ST_Transform(?, 94329)";

public static final String GET_ENVELOPE_IN_WGS84_FROM_GML_ID =
 "SELECT ST_Transform(co.envelope, 4326) " +
 "FROM CITYOBJECT co " +
 "WHERE co.gmlid = ?";

public static final String GET_ENVELOPE_IN_WGS84_3D_FROM_GML_ID =
 "SELECT ST_Transform(co.envelope, 94329) " +
 "FROM CITYOBJECT co " +
 "WHERE co.gmlid = ?";
```

The following example is a bit tricky. In *Oracle* it's possible to do a sort of pyramid-aggregation. That means aggregations are at primarily done on smaller groups which are then aggregated to bigger groups and so on (see GROUP BY-clauses at the end of the query). Depending on the size of the surface\_geometry-table it'll work much faster than the *PostGIS* ST\_Union-operation.

```

575 // public static final String QUERY_GET_AGGREGATE_GEOMETRIES_FOR_LOD =
//
// "SELECT sdo_aggr_union(mdsys.sdoaggrtype(aggr_geom,
// <TOLERANCE>)) aggr_geom " +
// "FROM (SELECT sdo_aggr_union(mdsys.sdoaggrtype(aggr_geom,
// <TOLERANCE>)) aggr_geom " +
// "FROM (SELECT sdo_aggr_union(mdsys.sdoaggrtype(aggr_geom,
// <TOLERANCE>)) aggr_geom " +
// "FROM (SELECT sdo_aggr_union(mdsys.sdoaggrtype(simple_geom,
// <TOLERANCE>)) aggr_geom " +

```

Like the CityGML-Export these RELATE-operations can't be sent as an PreparedStatement to the *PostGIS*-database. The queries have to be directly executed as statements in the *KmlSplitter* class.

de.tub.citydb.modules.kml.database.**KmlSplitter**

```

151 // BoundingBox tile =
rep exportFilter.getBoundingBoxFilter().getFilterState();
// OracleResultSet rs = null;
// PreparedStatement spatialQuery = null;
// try {
// spatialQuery =
// connection.prepareStatement(TileQueries.QUERY_GET_GMLIDS);
// int srid =
// DatabaseConnectionPool.getInstance().
// getActiveConnectionMetaData().getReferenceSystem().getSrid();

// spatialQuery.setInt(1, srid);
// // coordinates for inside
// spatialQuery.setDouble(2, tile.getLowerLeftCorner().getX());
// spatialQuery.setDouble(3, tile.getLowerLeftCorner().getY());
// spatialQuery.setDouble(4, tile.getUpperRightCorner().getX());
// spatialQuery.setDouble(5, tile.getUpperRightCorner().getY());
// spatialQuery.setInt(6, srid);

// // coordinates for overlapbdydisjoint
// spatialQuery.setDouble(7, tile.getLowerLeftCorner().getX());
// spatialQuery.setDouble(8, tile.getUpperRightCorner().getY());
// spatialQuery.setDouble(9, tile.getLowerLeftCorner().getX());
// spatialQuery.setDouble(10, tile.getLowerLeftCorner().getY());
// spatialQuery.setDouble(11, tile.getUpperRightCorner().getX());
// spatialQuery.setDouble(12, tile.getLowerLeftCorner().getY());

BoundingBox tile = exportFilter.getBoundingBoxFilter().getFilterState();
ResultSet rs = null;
Statement spatialQuery = null;
try {
 spatialQuery = connection.createStatement();
 int srid = dbSrs.getSrid();

 String queryString = "SELECT co.gmlid, co.class_id " +
 "FROM CITYOBJECT co " +
 "WHERE " +
 "ST_RELATE(co.envelope, 'SRID=" + srid + ";LINESTRING(" +
 tile.getLowerLeftCorner().getX() + " " +

 tile.getLowerLeftCorner().getX() + " " +
 tile.getLowerLeftCorner().getY() + "," +
 tile.getUpperRightCorner().getX() + " " +
 tile.getLowerLeftCorner().getY() +

```

```

 ")', 'T*T***T**') = 'TRUE' " + // overlap
 "UNION ALL " +
 "SELECT co.gmlid, . . .

```

The `BalloonTemplateHandlerImpl` class builds up a queries for the KML-balloon-content. Most of them are aggregated queries. If multiple rows are given in the `ResultSet` and no aggregation was used one row has to be picked. Therefore the window-function `ROW_NUMBER()` was used. As *PostgreSQL* does not allow the usage of window-function inside of a `WHERE`-clause the queries have to be re-written in a more nested way. Except for the first example, that didn't need a range-condition for `rnum` like in *Oracle*.

de.tub.citydb.modules.kml.database.**BalloonTemplateHandlerImpl**

```

1152 sqlStatement = sqlStatement + ") AS subquery"; // PostgreSQL-Query needs
rep an alias here

1204 // sqlStatement = "SELECT * FROM " +
// " (SELECT a.*, ROWNUM rnum FROM (" + sqlStatement +
// " ORDER by " + tableShortId + "." + columns.get(0) + " ASC) a"
// + " WHERE ROWNUM <= " + rownum + ") "
// + "WHERE rnum >= " + rownum;
sqlStatement = "SELECT * FROM " +
"(SELECT sqlstat.*, ROW_NUMBER() OVER(ORDER BY sqlstat.* ASC) AS rnum" +
 " FROM (" + sqlStatement +
 " ORDER BY " + tableShortId + "." + columns.get(0) + " ASC) sqlstat)
AS subq WHERE rnum = " + rownum;

// else if (FIRST.equalsIgnoreCase(aggregateFunction)) {
// sqlStatement = "SELECT * FROM (" + sqlStatement +
// " ORDER by " + tableShortId + "." + columns.get(0) + " ASC)" +
// " WHERE ROWNUM = 1";
// }
// else if (LAST.equalsIgnoreCase(aggregateFunction)) {
// sqlStatement = "SELECT * FROM (" + sqlStatement +
// " ORDER by " + tableShortId + "." + columns.get(0) + " DESC)"
// + " WHERE ROWNUM = 1";
// }

else if (FIRST.equalsIgnoreCase(aggregateFunction)) {
 sqlStatement = "SELECT * FROM " +

AS rnum FROM (" + sqlStatement +
 " ORDER BY " + tableShortId + "." + columns.get(0) + " ASC) sqlstat)
AS subq WHERE rnum = 1";
}
else if (LAST.equalsIgnoreCase(aggregateFunction)) {
 sqlStatement = "SELECT * FROM " +
"(SELECT sqlstat.*, ROW_NUMBER() OVER(ORDER BY sqlstat.* ASC)
AS rnum FROM (" + sqlStatement +
 " ORDER BY " + tableShortId + "." + columns.get(0) + " DESC)
sqlstat) AS subq WHERE rnum = 1";
}
}

```

## 9b. Geometries for Placemarks

Most of the changes were similar to examples in chapter 5 and more or less self-explaining. The `JGeometry.getOrdinatesArray()`-method is substituted with a simple iteration to fill an array. Some extra variables and *PostGIS*-JDBC-Classes (and its functions) are used to port *Oracle*'s *ELEM-INFO*-accessors correctly.

de.tub.citydb.modules.kml.database.**CityObjectGroup**

```
188 // STRUCT buildingGeometryObj = (STRUCT)rs.getObject(1);
 PGGeometry pgBuildingGeometry = (PGGeometry)rs.getObject(1);

```

## 9c. Textures for COLLADA-Export

The database can store textures-formats that are unknown to ORDImage. Therefore two methodologies were implemented in the KML-Exporter. One to deal with ORDImages and another to process all the unknown formats as BLOBs. Fortunately the last one could be used for the *PostGIS*-Port. All the TexOrdImage-methods had to be uncommented from the following classes and the texture-export for COLLADA-exports was slightly changed.

de.tub.citydb.modules.kml.database.**KmlGenericObject**

```

2215 // OrdImage texImage = null;
// InputStream texImage = null;

2228 // texImage = (OrdImage)rs2.getORADData("tex_image",
// OrdImage.getORADDataFactory());
texImage = rs2.getBinaryStream("tex_image");

addTexImageUri(surfaceId, texImageUri);
// if (getTexOrdImage(texImageUri) == null) { // not already marked as
// wrapping texture

BufferedImage bufferedImage = null;
try {
 //bufferedImage = ImageIO.read(texImage.getDataInputStream());
 bufferedImage = ImageIO.read(texImage);
}
catch (IOException ioe) {}
if (bufferedImage != null) { // image in JPEG, PNG or another
 usual format
}

```

```

 addTexImage(texImageUri, bufferedImage);
 }
 // else {
 // addTexOrdImage(texImageUri, texImage);
 // }
 // }

2318 removeTexImage(texImageUri);
 // addTexOrdImage(texImageUri, texImage);
 BufferedImage bufferedImage = null;
 try {
 bufferedImage = ImageIO.read(texImage);
 } catch (IOException e) {}
 addTexImage(texImageUri, bufferedImage);

```

de.tub.citydb.modules.kml.concurrent.**KmlExportWorker**

de.tub.citydb.modules.kml.controller.**KmlExporter**

de.tub.citydb.modules.kml.database.**ColladaBundle**

de.tub.citydb.modules.kml.database.**KmlExporterManager**

```

rep+ // uncommented TexOrdImage-methods

```
